APPLES -- BY VARIETIES
REVISED ESTIMATES OF PRODUCTION
1942-1946

Revised estimates of production of apples by varieties in commercial areas for the seasons 1942 to 1946 are presented in this report. These estimates are based on reports furnished by crop correspondents, commercial shippers, trade associations, cooperatives, field statisticians and co-operating State agencies. Changes from previously published estimates are the result of a change in level of total production indicated by the 1945 Census of Agriculture for the 1944 season and on other data that have become available since the original estimates were published.

In this report each variety is classified as summer, fall or winter. Summer varieties are those harvested in the summer months and as a rule can be safely stored for only a very short time. Fall varieties are classified as those harvested in late summer and early fall and have a relatively short storage period compared with winter apples. Winter apples are defined as those which are harvested in the fall and keep well in storage. The seasonal classification of certain varieties may vary in different sections of the country but in this report each variety is classified according to the season most representative for the country as a whole.

Commercial production of apples by varieties for the principal producing States are shown on pages 1 to 12. This arrangement is made to facilitate comparisons between varieties. On pages 13 to 25 the same data are presented for each principal variety by States and regions. The arrangement is shown in this form to facilitate comparisons between States and regions for the varieties listed.
